

## WART CHALLENGE

Many traditional treatments remove the visible wart but may not fully address the underlying viral infection: human papillomavirus (HPV).

When the virus is not disrupted, it's very likely that the wart(s) will reappear. Effective treatment should clear the wart, but also address the infection.

The Remy Laser works differently. By delivering therapeutic energy deep into the tissue, it helps stimulate your body's natural immune response - clearing warts comfortably and supporting long-term results.

### REMY RESULTS BEFORE & AFTER

**The Remy Laser Wart Removal System Effectively and Painlessly Eliminates Plantar Warts... Even Challenging Mosaic Warts**

## SAFE FOR ALL AGES

For Children and Adults Alike, The Remy Laser Offers a Safe, Pain-Free Solution & Decreases Recurrence of Stubborn Warts.

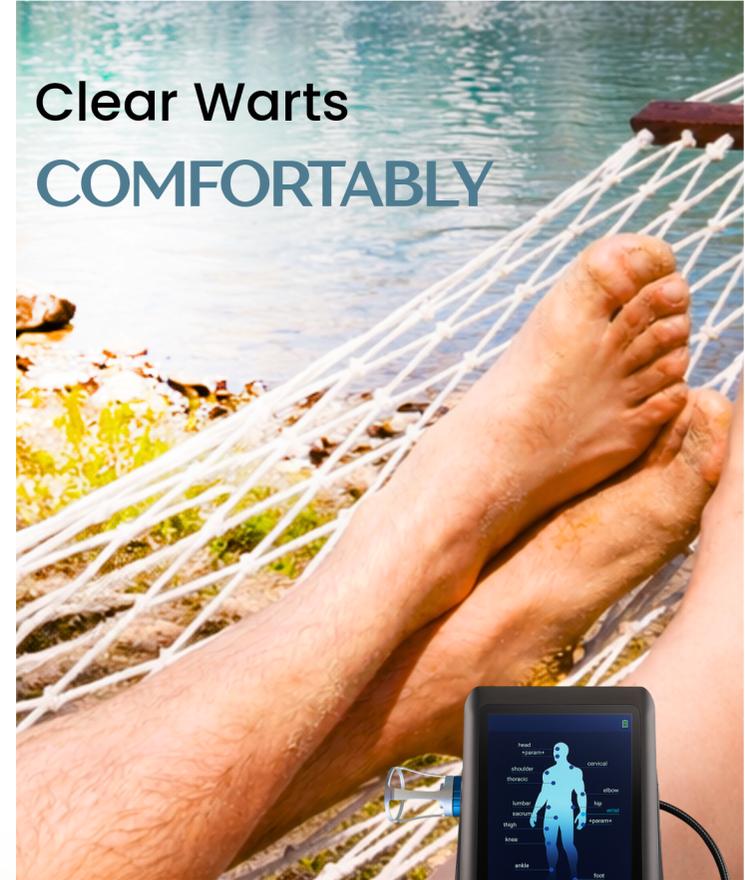

COMPREHENSIVE  
Foot &  
AnkleCenter

Progressive care, *with care.*

Collegeville Office  
555 2nd Ave Suite C-750

## Clear Warts COMFORTABLY

THE REMY  
*Safe & Effective Red Light Therapy*

## Finally A Pain-Free Solution That Works

The Remy Laser Painlessly Destroys Wart Tissue & The Blood Vessels Which Feed Them.

COMPREHENSIVE  
Foot &  
AnkleCenter

## THE SCIENCE

Class IV Lasers emit electromagnetic light (near-infrared light waves). When we utilize light waves for healing, the process is called **PHOTOBIOMODULATION**

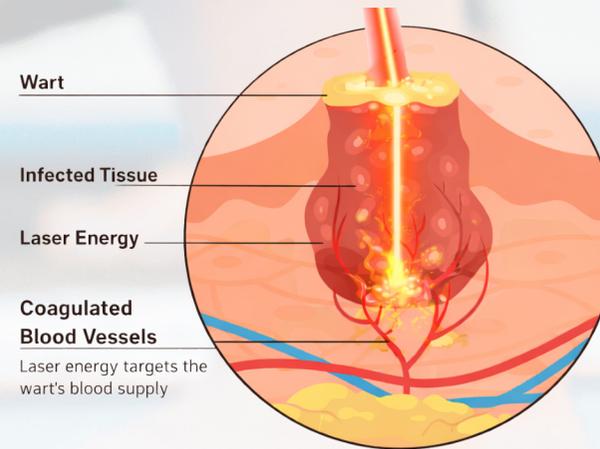

Once laser light “touches” the affected tissue, photons penetrate into the wart, targeting the abnormal virally infected cells without damaging healthy tissue.

When cells absorb laser energy, cellular activity increases - **enhancing circulation and supporting the body’s natural immune defense against infection** - like the HPV (the virus that causes warts).

## TARGETED EFFECTS

Rather than simply freezing, cutting, or chemically burning the surface of the skin, laser therapy works at the cellular level to target virally infected tissue and stimulate the body’s natural immune response.

### VASCULAR TARGETING

Warts rely on tiny blood vessels to supply oxygen and nutrients that allow the virus-infected tissue to survive.

Laser energy is absorbed by hemoglobin within these vessels, generating controlled heat that coagulates and collapses the wart’s blood supply.

By disrupting this vascular network, the wart is deprived of nourishment, allowing the body to gradually break down and eliminate the treated tissue.

## PATIENT FAQs

### Is Class IV Laser Therapy Safe?

Yes. Yes. Class IV Laser Therapy is a safe, FDA-cleared treatment option for warts.

### What Does Class IV Laser Therapy Feel Like?

Most patients feel a warming sensation during treatment. The procedure is quick, well tolerated, and typically requires no anesthesia. There is little to no downtime.

### Why Choose Class IV Laser Therapy?

Traditional treatments such as freezing, acid applications, or surgical removal may require multiple visits and can damage surrounding tissue. Laser therapy targets the wart precisely while preserving healthy skin.

### When Will I See Results?

Laser therapy begins working immediately by disrupting the wart tissue and its blood supply. The treated wart may darken, dry, or gradually shrink over the following weeks as the body eliminates it.

### How Long is the Treatment?

Treatment time depends on the size and location of the wart, but most sessions take only a few minutes. Some warts resolve after one treatment, while others may require additional sessions based on severity and duration.
